
LOCAH — COMPLETE PROJECT & PRODUCT BRIEF

1. WHAT IS LOCAH?

LOCAH is an operating layer for local businesses.

The fundamental idea is:

A local business should not need to separately buy a website, marketplace presence, ordering system, booking system, payment system, customer system, inventory tool, workforce tool and analytics software just to operate digitally.

LOCAH brings these capabilities together around **one Business identity and one underlying dataset.**

A Business can have:

- its own digital presence/website
- Marketplace presence
- products/services/menu
- orders
- bookings
- payments
- memberships
- customers
- leads
- inventory
- fulfilment
- workforce
- notifications
- operational insights
- business administration
- AI-assisted setup and operation

The important part is that these are **not isolated applications.**

They are different surfaces and capabilities operating on the same Business foundation.

The architecture explicitly describes one Business identity being rendered across multiple surfaces: public website, Marketplace, merchant Workspace, consumer experience and future AI/API surfaces.

2. WHY LOCAH EXISTS

The problem came from real local-business website work.

A small business might pay a freelancer ₹15,000–₹20,000 or more for a website.

The website is created.

Then:

- prices change
- menus change
- services change
- images become outdated
- nobody updates the site
- customers don't necessarily discover it
- actual business operations still happen through WhatsApp, paper registers and separate billing tools

The website becomes a brochure rather than an operating system.

Meanwhile:

- orders are separate
- bookings are separate
- payments are separate
- inventory is separate
- customer information is scattered
- discovery happens on aggregators
- the business has no unified digital identity

LOCAH is designed around the idea that a business needs three connected things:

1. Presence

The business gets a proper digital presence.

2. Operations

The business can actually run relevant operations.

3. Discovery

Customers can discover the business and interact with it.

The three layers are designed to work together rather than becoming disconnected products.

3. WHO USES LOCAH?

LOCAH has multiple distinct experiences.

A. Visitor

Someone who simply visits the LOCAH website.

They should understand:

- what LOCAH is
- what it does
- why it is useful
- how businesses use it
- how customers use it

They can then choose:

- Explore Marketplace
 - Start a Business
 - Sign In
 - Learn about capabilities
-

4. BUSINESS OWNER

The Business Owner is the central operator.

Their journey is approximately:

LOCAH

Get Started

Create account

Create Business

Select / identify Business type

Tell LOCAH about the Business

LOCAH recommends relevant capabilities

Business chooses capabilities

AI creates initial Business presence

Website draft

Edit

Preview

Publish

Workspace

Run Business

The onboarding should **not** be a giant 40-field form.

The canonical experience architecture specifically calls for **generation-first progressive onboarding** where the platform adapts based on Business type, operating model, selected modules, information already provided and owner choices.

5. BUSINESS TYPES

LOCAH is deliberately horizontal.

It is NOT:

"A restaurant website builder."

The same platform should work for:

- Restaurant
- Home food business
- Café
- Retail
- Salon

- Gym / Fitness
- Hotel / Stay
- Clinic
- Professional service
- Real estate
- Classes / Coaching
- Events / Experiences
- Local service businesses
- Other businesses

The important architectural principle is:

Business types are configuration, not separate products.

A Business-Type Profile recommends:

- relevant modules
- terminology
- setup questions
- website structure
- dashboard emphasis
- configuration defaults

But the Business type does **not** force the Business to use those capabilities.

For example:

A restaurant might see:

Menu
Orders
Payments
Fulfilment

A salon might see:

Services
Appointments
Staff
Availability
Payments

A gym might see:

Memberships
Classes

Bookings
Trainers
Payments

A hotel might see:

Rooms
Availability
Bookings
Guests
Payments

This is achieved through configuration and capabilities rather than separate codebases.

6. THE BUSINESS ONBOARDING EXPERIENCE

The onboarding should feel like LOCAH is **understanding the business**, not asking the owner to configure software.

For example, a restaurant owner might provide:

"We are a small vegetarian restaurant in Chennai. We serve South Indian breakfast, lunch and dinner."

LOCAH can then understand:

- Business type
- likely offering structure
- menu-oriented terminology
- relevant website structure
- potentially relevant operational capabilities

Then ask only the information it actually needs.

For example:

Basic information

- Business name
- Location
- Contact details
- Description
- Logo
- Brand information

Visual information

- Logo

- Hero image
- Business images

If an appropriate hero image isn't provided and the supported AI/image system allows generation, the system can assist.

Business information

Depending on type:

Restaurant:

- menu
- categories
- items
- pricing
- timings

Salon:

- services
- durations
- pricing
- staff
- availability

Gym:

- membership plans
- classes
- schedules
- trainers

Hotel:

- rooms
- room types
- availability
- amenities

Real estate:

- properties
- property details

- enquiry information

The exact questions should adapt rather than every Business seeing the same questionnaire.

7. AI IN LOCAH

AI is extremely important, but **AI is not the product itself**.

LOCAH uses **constrained AI generation**.

The dangerous approach would be:

User

↓

"Make me a website"

↓

LLM

↓

Huge HTML response

↓

Website

That produces unpredictable results and cannot understand the underlying business system.

LOCAH instead follows:

Business information

+

Business-Type Profile

+

Capability registry

+

Business choices

↓

AI generation

↓

Structured schema

↓

Validation

↓

Repair/fallback if necessary

↓

Draft

↓

Human review

↓

Publish

The AI cannot decide:

- Business ownership
- permissions
- entitlements
- pricing
- payment state
- publication authority
- tenant boundaries
- module authority

Those remain platform-controlled.

The canonical AI design uses retrieval, schema-constrained generation and deterministic validation specifically to prevent AI from producing capabilities the platform cannot actually support.

8. WEBSITE GENERATION

This is one of LOCAH's major product experiences.

The Business does not receive a generic template with its name swapped.

The website is generated from the Business's structured information.

Potential inputs include:

- logo
- brand
- description
- images
- hero

- offerings
- menu/services
- categories
- location
- contact
- hours
- relevant modules
- Business type
- Business preferences

The result is a **structured website**.

Not arbitrary code.

Not unrestricted HTML.

Not a developer editor.

9. WEBSITE TEMPLATE SYSTEM

LOCAH should eventually provide two complementary entry paths:

Start from Template

The owner chooses a visually designed starting point.

AI Recommended Starting Point

LOCAH understands the Business and recommends a suitable structure.

Both should ultimately produce the same underlying structured Website model.

Conceptually:

Template

\

 → Structured Website → Editor → Preview → Publish

 /

AI recommendation

Templates should cover different Business personalities.

Examples:

- Premium restaurant
- Home food brand

- Modern café
- Fitness studio
- Premium salon
- Boutique hotel
- Real estate agency
- Professional consultancy
- Local service business
- Retail business

The template system should not become a completely separate architecture from AI generation.

10. WEBSITE EDITOR

The owner should be able to edit the generated result without knowing code.

They should be able to:

- edit text
- replace images
- add products/services
- remove products/services
- edit categories
- reorder items
- modify sections
- change navigation
- change theme
- change business information
- preview
- publish

The editor should feel closer to a modern website/product editor than a developer interface.

11. AI WEBSITE REFINEMENT

AI can also assist after generation.

For example:

"Make the homepage more premium."

"Add a section for our new services."

"Change the hero text."

"Make the restaurant menu easier to browse."

The AI should modify the **structured Website model**, not generate arbitrary frontend code.

This distinction is extremely important.

12. WEBSITE RENDERING

The Website is a rendering of the Business.

This is one of the most important LOCAH concepts.

For example:

A restaurant's website doesn't merely contain text saying:

"Our Menu"

The Menu section can connect to actual structured offerings.

Those offerings can then connect to:

- cart
- orders
- checkout
- payments

Similarly:

A salon's services can connect to:

- booking
- availability
- staff

A gym's memberships can connect to:

- membership flows
- payment

Therefore:

Website

Business data

Modules

Transactions / operations

The website is therefore not merely a brochure.

It is a **public rendering of the Business operating system**.

The technical architecture explicitly defines Website/Public Presence as a structured Website entity containing pages, sections, navigation, theme and domain configuration.

13. BUSINESS WEBSITE VS MARKETPLACE

These are deliberately different.

Business Website

Owned by the Business.

If the owner shares:

locah.com/business/my-business

or eventually their own domain, the customer should experience **that Business**.

The Business's brand should dominate.

No unnecessary competing businesses.

This is called the **two-surface doctrine**.

14. TWO-SURFACE DOCTRINE

LOCAH has two important public surfaces.

Surface 1 — Business-owned experience

The merchant's own link.

The customer sees:

That business.

The goal is ownership and trust.

Surface 2 — LOCAH Marketplace

The customer intentionally came to LOCAH to discover businesses.

Here competition is useful.

The customer can compare:

- businesses

- offerings
- services
- locations
- relevant information

The Marketplace is therefore a discovery network.

This distinction is one of the central strategic ideas of LOCAH.

15. MARKETPLACE

Marketplace is a separate first-class product surface.

A normal customer should be able to:

Open LOCAH

Marketplace

Search / category / location

Discover Business

Open Business profile

Explore offerings

Open Business website

Order / Book / Contact

Complete action

The Marketplace should support different kinds of Businesses.

It should not look like:

restaurant listings only.

It needs to understand:

- products
- services
- appointments
- bookings
- memberships
- enquiries
- other supported capabilities

The Marketplace Business profile and Business storefront are distinct renderings of the same canonical Business.

16. CONSUMER EXPERIENCE

Consumers should have their own experience.

This is separate from Business Workspace.

A consumer may:

- browse Marketplace
- explore Businesses
- view products/services
- order
- book
- pay
- track
- manage activity
- view orders
- view bookings
- manage their account

Authentication should not be forced unnecessarily.

For example, public discovery can happen without signing in.

Authentication should appear when the action genuinely requires identity or saved data.

The canonical navigation architecture explicitly separates Personal/Consumer context from Business context.

17. MY ACTIVITY

The consumer has **My Activity**.

This is where the customer can understand their relationship with transactions on LOCAH.

Examples:

- Orders
- Bookings
- Payment/activity
- Memberships
- relevant transaction history

The Business owner does NOT own the consumer's personal Activity context.

Consumer activity remains identity-scoped.

18. BUSINESS WORKSPACE

Workspace is the business owner's operating environment.

Think:

"What does the owner need to know when they open LOCAH in the morning?"

The canonical Product Experience Bible calls this the **morning test**:

What matters now?

The dashboard should therefore not simply contain:

₹12,450

24 Orders

17 Customers

3 Bookings

with no context.

Instead it should help the owner understand:

- what happened
- what needs attention
- what's pending
- what is selling
- what is booked
- what has been paid
- what needs fulfilment

- what operational issue needs action

The Workspace should adapt to the Business.

A restaurant may prioritize:

- orders
- preparation
- pickup
- delivery

A clinic:

- appointments
- queue
- providers

A gym:

- memberships
- classes
- renewals

A salon:

- appointments
- staff
- availability

The canonical UX rules explicitly reject one universal dashboard composition.

19. ADAPTIVE NAVIGATION

LOCAH should NOT show every possible feature to everyone.

Navigation depends on:

Business

+

Business Type

+

Enabled Modules

+

Entitlement

+

Configuration

+

Location

+

Role

+

Permissions

+

Current state

Therefore one Business might see:

Home

Website

Menu

Orders

Payments

Customers

Inventory

Fulfilment

Analytics

Settings

while another might see:

Home

Website

Services

Bookings

Customers

Workforce

Payments

Settings

Business type only **recommends**.

The actual experience comes from the capabilities the Business chooses and the user's authority.

20. THE 10 PLATFORM CORE CAPABILITIES

Every Business receives the Platform Core.

1. Business Identity

The canonical Business.

Contains the fundamental identity and lifecycle.

2. Business Profile

Contains:

- description
 - logo
 - cover/media
 - contact
 - public information
 - profile completeness
 - Marketplace projection
-

3. Website / Public Presence

Every Business has a Website foundation.

It provides:

- structured pages
 - sections
 - themes
 - navigation
 - preview
 - publishing
 - public rendering
-

4. Workspace Foundation

Provides:

- Business context
 - Location context
 - adaptive navigation
 - operational Home
 - permission-aware UI
 - setup/recovery states
-

5. Settings

Business configuration.

6. Locations

A Business can have multiple Locations.

For example:

Business

├— Chennai Branch

├— Velachery Branch

└— Anna Nagar Branch

Locations are subordinate to the Business.

They are NOT separate tenants.

Location can affect:

- hours
 - availability
 - inventory
 - bookings
 - workforce
 - service area
 - offerings
-

7. Team / Roles / Access

Controls:

- Primary Owner

- Manager
- Member
- invitations
- permissions
- Location scope

A person's job title does not automatically give them unlimited access.

8. Module Management

The owner can:

- discover capabilities
 - understand what they do
 - enable them
 - configure them
 - deactivate them
 - re-enable them
-

9. Notifications

Provides:

- operational notifications
 - setup notifications
 - payment/provider exceptions
 - in-platform notification inbox
 - preferences
-

10. Marketplace Presence

Controls the Business's Marketplace representation.

These ten Core groups are explicitly defined as universal First Launch capabilities.

21. OPTIONAL BUSINESS MODULES

LOCAH has a canonical registry of **21 optional Business modules**.

These are capabilities that a Business can use depending on its needs.

Important examples include:

Offerings Catalog

Products, services, menus, packages, classes, variants and options.

Orders

Handles:

- cart
 - purchase
 - order lifecycle
 - status
 - cancellation
 - refund coordination
-

Bookings

Handles:

- appointments
 - reservations
 - sessions
 - consultations
 - classes
 - availability
-

Queue Operations

Handles:

- walk-in queues
- tokens
- waiting
- provider routing

This is later, not First Launch.

Customer Relationships

Handles:

- customer records
 - history
 - notes
 - tags
 - customer context
-

Leads

Handles:

- enquiries
 - prospects
 - pipeline
 - follow-up
 - conversion
-

Inventory

Handles:

- stock
 - availability
 - adjustments
 - inventory state
-

Fulfilment

Handles:

- pickup
 - local delivery
 - shipping/courier modes
 - fulfilment status
-

Workforce

Handles:

- operational staff/providers
 - schedules
 - availability
 - service assignment
-

Payments

Handles Business-side payment capabilities.

Memberships

Handles customer membership plans/packages and their lifecycle.

Other canonical modules include:

- Invoicing
- Loyalty
- Messaging
- Marketing
- Reviews
- Analytics
- Payroll
- Business Passport
- Business Community
- B2B Network

The complete registry contains 21 optional Business modules.

22. IMPORTANT: NOT ALL 21 MODULES ARE FIRST LAUNCH

This is one of the easiest things for a new team member to misunderstand.

The architecture contains 21 optional modules.

But **First Launch does not mean build all 21 to full depth.**

First Launch specifically includes five Full/Launch-Ready modules:

1. Offerings Catalog
2. Orders

3. Bookings
4. Payments
5. Memberships

And five Basic/Controlled-Depth modules:

6. Customer Relationships
7. Leads
8. Inventory
9. Fulfilment
10. Workforce

The other modules are later/future according to the approved launch scope.

23. WHAT "BASIC" MEANS

Basic does NOT mean fake.

For example:

Inventory may have:

- stock overview
- stock detail
- adjustment
- low-stock alerts

but not:

- advanced procurement
- supplier management
- warehouse management
- forecasting

Similarly Workforce may have:

- people/providers
- profiles
- service associations
- schedules
- availability

but not full HR/payroll.

First Launch deliberately validates reusable primitives rather than building complete ERP systems.

24. ENTITLEMENT SYSTEM

One of LOCAH's important architectural concepts is that these are NOT the same thing:

Entitled

≠

Enabled

≠

Configured

≠

Permitted

For example:

A Business may have Orders commercially available.

But:

Entitled: YES

Enabled: NO

Configured: NO

Owner permitted: YES

So the owner sees:

Orders available — Enable

After enabling:

Entitled: YES

Enabled: YES

Configured: NO

Then:

Finish setup

Once configured:

Entitled: YES

Enabled: YES

Configured: YES

Permitted: YES

Now the owner can operate it.

This separation is fundamental to LOCAH's modular architecture.

25. BUSINESS TYPE DOES NOT GRANT ACCESS

This is another critical rule.

Selecting:

Restaurant

does NOT automatically mean:

Orders + Payments + Inventory activated.

The Restaurant profile can recommend those capabilities.

The owner decides.

Therefore:

Business Type

Recommendation

Owner Choice

Entitlement

Activation

Configuration

Permission

Actual capability

This keeps LOCAH flexible.

26. EXAMPLE: RESTAURANT

A restaurant could have:

Platform Core

+

Offerings Catalog

+

Orders

+

Payments

+

Fulfilment

Its Website might show:

Home

Menu

About

Location

Contact

Order Now

Menu comes from actual Offerings.

Order Now connects to actual Orders.

Payment connects to Payments.

Delivery/pickup connects to Fulfilment.

The Workspace then shows:

Today's Orders

Pending Orders

Revenue

Payments

Fulfilment

Customers

Inventory

This is what makes LOCAH more than a website builder.

27. EXAMPLE: SALON

A salon might use:

Platform Core

+

Offerings Catalog

+

Bookings

+

Payments

+

Workforce

+

Customer Relationships

Its Website could show:

Home

Services

Stylists

About

Gallery

Book Appointment

Contact

Customer:

Find salon

↓

View services

↓

Choose service

↓

Choose time

↓

Book

↓

Pay/deposit if configured

My Activity

Owner:

Workspace

Today's appointments

Staff availability

Customers

Payments

28. EXAMPLE: GYM

A gym might use:

Platform Core

+

Offerings Catalog

+

Memberships

+

Bookings

+

Payments

Website:

Home

Programs

Memberships

Classes

Trainers

Contact

Consumer:

Discover gym

View plans

Choose membership

Purchase

Manage membership

Owner:

Memberships

Bookings

Customers

Payments

Operations

29. EXAMPLE: HOTEL

A hotel can use the same architecture without becoming a full PMS.

It can support appropriate:

- rooms/stay offerings
- availability
- bookings
- payments
- guests
- business website
- Marketplace discovery

But First Launch explicitly does not attempt to replace a complete enterprise hotel PMS.

30. EXAMPLE: REAL ESTATE

A real-estate Business can use:

- Business Profile
- Website
- Marketplace presence
- Offerings/listings
- Leads
- Customer Relationships
- Bookings/appointments where applicable

The important idea is that the platform doesn't need a completely separate "Real Estate App."

The Business-Type Profile adapts the generic platform primitives.

31. PAYMENTS

Payments is a First Launch Full module.

The architecture deliberately uses a provider abstraction.

The Business should be able to understand:

- payment connection state
- payment readiness
- transactions
- refunds where supported
- payment status
- configuration
- relevant recovery states

Payment state must remain authoritative in the backend.

The frontend must never invent payment success.

32. ORDERS

Orders can contain:

- customer
- items
- totals
- fulfilment

- payment
- Location
- timeline
- status

Example lifecycle:

Pending

↓

Accepted

↓

Preparing

↓

Ready

↓

Completed

Possible alternative states:

Cancelled

Refunded

The owner operates the order from Workspace.

The consumer sees their order through the consumer experience/My Activity.

33. BOOKINGS

Bookings can represent:

- appointments
- consultations
- classes
- reservations
- sessions

The owner can manage:

- calendar
- booking list
- availability

- booking details
- policies
- confirmation
- cancellation
- rescheduling

The exact presentation adapts to the Business.

34. MEMBERSHIPS

Memberships are customer-facing Business memberships.

They are NOT the same thing as a Business's LOCAH subscription.

For example:

A gym may sell:

Monthly Gym Membership — ₹1,999

That is a **customer membership**.

The gym itself may separately have a LOCAH commercial plan.

The canonical module is therefore called memberships to avoid confusing it with platform subscriptions.

35. ANALYTICS

There are two different concepts:

Core operational insights

Part of the Workspace.

These help answer:

What matters now?

Full Analytics module

A later/deeper capability.

Full Analytics may eventually include:

- advanced reporting
- cohorts
- LTV
- attribution

- advanced data analysis
- exports

First Launch does NOT require the full Analytics module.

This distinction is explicitly established in the First Launch scope.

36. AI EMPLOYEES

LOCAH's architecture defines a future roster of **13 AI Employee modules**.

Examples:

- AI WhatsApp Manager
- AI Content Creator
- AI Marketing Manager
- AI Business Analyst
- AI Inventory Manager
- AI Sales Executive
- AI Appointment Manager
- AI Follow-up Manager
- AI Customer Support
- AI Finance Assistant
- AI Delivery Coordinator
- AI SEO Manager
- AI Receptionist

These are **not all First Launch features**.

They are part of the future AI architecture.

The current First Launch AI requirement is primarily **governed Website generation and related AI-assisted setup**, not autonomous AI employees.

37. B2B — LOCAH SUPPLY

B2B is strategically one of LOCAH's major future differentiators.

The idea is:

Institutional Buyers

Recurring Demand

LOCAH Supply

Demand Aggregation

Forecasting

Supply Matching

Farmers / FPOs / Wholesalers

For example, a buyer might send:

"Tomorrow 100 kg tomato, 50 kg onion."

The system can convert that into structured demand.

The initial conceptual wedge is agricultural supply, especially vegetables, because:

- demand is recurring
- supply is fragmented
- shelf life is short
- prices fluctuate
- wastage can be measured
- geography matters

The architecture describes B2B as a later b2b-network capability, and the current ChitBridge/B2B implementation is separate.

Therefore a team member must **not pretend that full B2B is already integrated into LOCAH First Launch.**

38. CURRENT CHITBRIDGE RELATIONSHIP

ChitBridge is the current separately deployed B2B system.

Conceptually:

LOCAH

└─ Merchant operating layer

Do not merge ChitBridge blindly into the current LOCAH implementation.

The future architecture should allow integration, but the First Launch product should not fake a complete integrated B2B network.

39. USER CONTEXTS

LOCAH has different operating contexts.

Personal / Consumer

For:

- discovery
- orders
- bookings
- activity
- account

Business

For:

- Business operations
- website
- modules
- orders
- bookings
- customers
- payments
- settings

Administration

For:

- support
- platform operations
- Business investigation
- configuration
- audit
- system health

These contexts must remain visibly distinct.

40. MULTI-BUSINESS SUPPORT

One Platform Identity can belong to multiple Businesses.

For example:

Kausik

Access is independently evaluated per Business.

Switching Business requires re-evaluating:

- membership
- Location scope
- permissions
- Entitlements
- enabled modules
- configuration

- resource state

A remembered Business cannot grant access by itself.

41. LOCATIONS

Location is subordinate to Business.

Example:

Business

└─ Chennai

└─ Velachery

└─ Anna Nagar

Different Locations may have:

- different hours
- different inventory
- different staff
- different availability
- different service areas
- different offerings availability

But they remain part of the same Business.

42. ROLES

Core roles include:

Primary Owner

Highest Business ownership authority.

Manager

Operational authority within assigned limits.

Member

Explicitly granted capabilities.

There can also be configurable templates such as:

- Accountant
- Receptionist
- Doctor

- Trainer
- Cashier
- Inventory Manager

But:

"Receptionist" is not itself a permission.

The effective permission set determines what the person can actually do.

43. SECURITY MODEL

LOCAH is multi-tenant.

A Business must never be able to access another Business's private data.

The architecture uses:

- server-side authorization
- Business context
- Location context
- permission evaluation
- Entitlement evaluation
- PostgreSQL RLS
- scoped execution contexts
- audit
- controlled privileged operations

The backend remains authoritative.

The frontend hiding a menu item is **not** security.

Every protected route/action must still be enforced by the backend.

44. TECHNICAL ARCHITECTURE

The platform uses a modular-monolith architecture.

Frontend

TypeScript / Next.js.

Applications include:

apps/web

apps/workspace

apps/admin

Backend

FastAPI

Python

SQLAlchemy

Pydantic

Database

PostgreSQL

Supabase

Worker

Python worker for:

- outbox
- asynchronous jobs
- scheduled jobs
- background processing

AI

Hosted AI models through an AI runtime abstraction.

Storage

Object/media storage.

Search

Search/discovery infrastructure.

Payments

Provider abstraction.

The implementation blueprint defines the frontend/backend/worker/database boundaries and keeps FastAPI authoritative for business rules, authorization and state.

45. EVENT / OUTBOX MODEL

Cross-module operations should not randomly access another module's database tables.

Instead:

Module A

↓

Local transaction

Domain record

+

Outbox event

Worker

Module B / notification / search / projection

This provides reliable asynchronous processing.

The system intentionally uses a transactional outbox rather than introducing unnecessary distributed transactions.

46. FIRST LAUNCH SCOPE

The First Launch is intentionally broad but controlled.

It includes:

- Platform Core
- Identity/Auth
- progressive onboarding
- adaptive Workspace
- structured Website generation
- Website editing
- preview
- publishing
- Marketplace
- My Activity
- Offerings
- Orders
- Bookings
- Payments
- Memberships

- basic Customer Relationships
 - basic Leads
 - basic Inventory
 - basic Fulfilment
 - basic Workforce
 - Notifications
 - operational insights
 - commercial/entitlement recovery
 - Admin/support
 - audit
 - tenant isolation
 - webhook durability
 - observability
 - backup/recovery
 - provider failure handling
-

47. WHAT FIRST LAUNCH IS NOT

Do not turn LOCAH into:

- full Shopify replacement
- full Wix/Webflow replacement
- full hotel PMS
- full hospital system
- full ERP
- full accounting suite
- full payroll system
- Salesforce-scale CRM
- proprietary courier network
- unrestricted AI website coding tool

The First Launch validates shared primitives rather than recreating every specialized industry software product.

48. PAGE ARCHITECTURE

The full product specification contains a very large page inventory.

The documented product experience contains **206 page families** across:

- Main Platform Website
- Authentication
- Marketplace
- My Activity
- Business Website
- Business Onboarding
- Business Workspace
- Optional Modules
- AI Experience
- Commercial Experience
- Platform Super Admin

However, those 206 page families are **not equivalent to "build 206 completely separate screens immediately."**

They represent the full product experience architecture.

First Launch determines which are actually required and at what depth.

49. THE MAIN USER STORY

The entire product can be understood through one story.

A business owner:

"I run a small salon."

They open LOCAH.

LOCAH Homepage

Start Business

Salon

Tell us about your salon

↓

Upload logo

↓

Add images

↓

Describe services

↓

My Activity

Owner sees:

Workspace

Today's bookings

Staff availability

Customers

Payments

Memberships

Insights

That is LOCAH.

50. WHAT MAKES LOCAH DIFFERENT FROM "GEMINI MAKES A WEBSITE"?

This is critical.

Someone can already go to Gemini/ChatGPT and say:

"Make me a website for my salon."

That is not LOCAH's value.

LOCAH owns:

Business identity

+

Business data

+

Structured Website

+

Templates

+

Marketplace

+

Offerings

+

Orders

+

Bookings

+

Payments

+

Customers

+

Memberships

+

↓

A generic AI website generator does not own that operating loop.

51. THE CORE LOCAL LOOP

The diagram illustrates a two-sided market structure. It consists of two horizontal lines representing the 'BUSINESS SIDE' and the 'CONSUMER SIDE'. On the Business Side, there is a vertical tick mark labeled 'LOCAH'. On the Consumer Side, there is a vertical tick mark. A bracket connects the two sides, indicating a relationship or interaction between them.

Everything ultimately revolves around the same canonical Business and identity system.

52. WHAT THE UI SHOULD FEEL LIKE

LOCAH should feel like a **real commercial product**.

Not:

- college project
- admin template
- generic AI dashboard
- collection of CRUD pages

The Product Experience Bible establishes the governing principle:

Does the experience make the person's purpose clearer, easier and more trustworthy, or does it make them manage the software?

The UI should therefore be:

- minimal
- premium
- clear
- purposeful
- professional
- responsive
- accessible
- fast
- visually distinctive

Premium quality should come primarily from:

- typography
- spacing
- composition
- consistency
- responsiveness
- interaction
- performance
- precise execution

not from throwing gradients and animations everywhere.

53. HOMEPAGE PHILOSOPHY

The LOCAH homepage should answer immediately:

What is LOCAH?

The operating layer for local businesses.

What can a business do?

Build its presence, get discovered and run its business.

What can a customer do?

Discover local businesses, explore what they offer and interact with them.

Why is it different?

Because the website, Marketplace and operations are connected.

The homepage should then visually demonstrate the actual product.

Not just explain it.

54. PRODUCT NAVIGATION

Public:

LOCAH

Home

Marketplace

For Businesses

Solutions

Pricing

Resources

with:

Log in

Get Started

Business Workspace:

Home

Website

Offerings

Orders

Bookings

Customers

Payments

Memberships

Inventory
Fulfilment
Workforce
Analytics/Insights
Notifications
Modules
Settings

But this is **adaptive**, not a mandatory sidebar containing everything.

Consumer:

Discover
Marketplace
Activity
Account

with appropriate transaction/detail pages.

Admin:

Overview
Businesses
Users
Support
Operations
Audit

System/Provider Health

Again, actual routes and labels must follow the canonical specifications and effective permissions.

55. WHAT IS ALREADY ARCHITECTED

The project is not starting from zero.

The canonical documentation establishes:

- product vision
- product experience principles
- Business kernel
- master product specification

- user context/navigation architecture
- access/permission model
- Business-Type Profile architecture
- Plans/Modules/Entitlement architecture
- page-by-page product architecture
- data/technical architecture
- First Launch scope
- engineering implementation blueprint

The implementation has also progressed substantially through:

- monorepo
- Next.js applications
- FastAPI backend
- Python worker
- PostgreSQL/Supabase
- identity/auth
- Business/context handling
- RLS
- modules
- Marketplace
- Website generation
- Website renderer
- Orders
- Bookings
- Payments foundations
- notifications
- outbox/jobs
- tests
- CI
- frontend foundation

The current task is therefore **not inventing LOCAH**.

It is turning the already-defined architecture into a polished, complete, demonstratable product experience.

56. WHAT THE TEAM SHOULD NEVER DO

Do not build separate applications for every industry.

Use Business-Type Profiles.

Do not make Business Type automatically grant modules.

It only recommends.

Do not let AI own canonical Business state.

Backend owns it.

Do not generate arbitrary website code.

Use structured Website generation.

Do not make the Marketplace identical to the Business website.

They serve different purposes.

Do not show every module to every Business.

Use adaptive navigation.

Do not confuse permissions with entitlement.

They are separate.

Do not make frontend hiding the security mechanism.

Backend authorization is authoritative.

Do not build fake analytics.

Only display real data.

Do not fake B2B integration.

ChitBridge/B2B is currently separate.

Do not build the entire future 21-module ecosystem just because the registry contains 21 modules.

First Launch has controlled depth.

Do not turn LOCAH into a generic chatbot.

AI is a capability inside the operating system.

57. THE SINGLE SENTENCE A TEAM MEMBER SHOULD REMEMBER

If someone asks:

"What exactly are we building?"

The answer is:

LOCAH is a platform where a local business can establish its digital presence, get discovered by customers, and run its relevant business operations through one connected Business identity — with AI reducing the work required to set everything up.

And for the consumer:

LOCAH is a place to discover local businesses and interact with what they actually offer — not merely look at listings.

58. THE PRODUCT IN ONE FLOW

Ultimately:

OWNER

"Create my business"

LOCAH understands the business

Business profile

AI/template website

Edit

Publish

Marketplace presence

Customer discovery

Customer buys/books

Payment

Order/booking

Customer Activity

Business Workspace

Operations

Insights

Business grows

That is the complete LOCAH product story.

The technical architecture exists to make that loop **reliable, modular, secure and extensible**; the UI exists to make that loop **understandable and effortless**.

The team should therefore think of LOCAH as **one connected operating system for local businesses**, not as "a website builder with some dashboards attached."
